Tumor Angiogenesis

New idea which came to me while talking
to Julie Glowacki

(1) The cartilage disc which arises from demineralized bone powder - appears to have precise program - like built-in clock, for the time of vascular penetration = 12th day.

(2) Does an inhibitor fade out? - But if so, why then do capillaries come in - when other normal tissues are unable to induce them? There, does an stimulator appear on Day 12.

(3) Two, next experiments

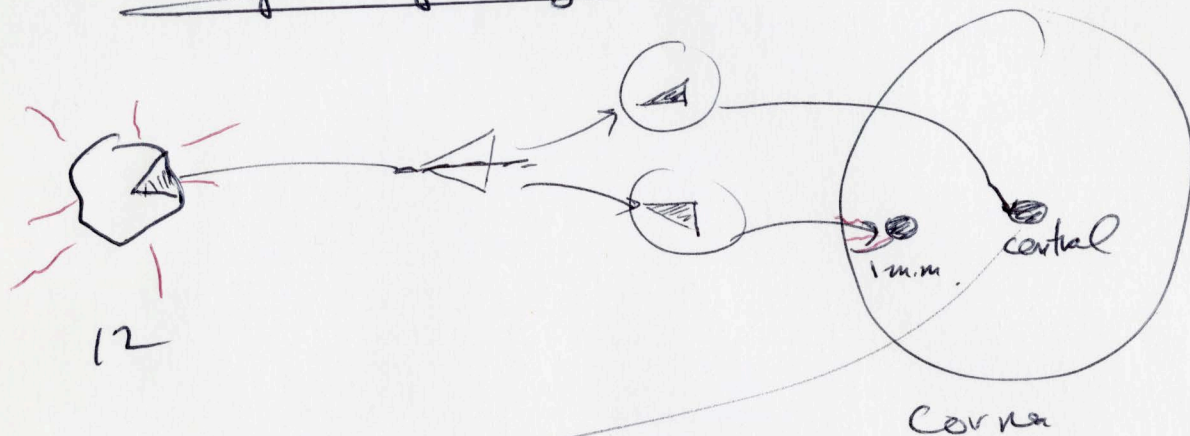

See which cartilage can induce vessels, if any.

6-10-76

(2)

Secondly can take the stage of
vasculization and see if onset of
vasculization can be delayed by simple
change in geometry

→ Then move this to peripheral cornea P
1 month (or 2 months)
