

[... is however.]

The Primary B. Matter

(1809.

We spoke in our last lecture of the division of Philosophy into its three great objects - God - Nature & Man. We spoke also of w^t L^d Bacon calls the pyramid of the sciences, whose basis is Nat^e History, but whose apex was too high to be clearly distinguished by the human intellect.

We glanced at that chain of existence w^c unites all beings, and connects all worlds, and w^c is, according to heathen mythology, fastened to the foot of Jupiters throne.

We also spoke of that Great Book of Nature, that Sacred scripture w^c is written by the finger of the Deity himself upon every animal, every plant, and every mineral in creation. We spoke of the objects w^c usually attract the wondering eyes of youthful curiosity.

We told you that the teraqueous globe w^c we inhabit was every where surrounded by the elements, so called; and was made up of the three Kingdoms of Nature, viz the Inorganic - the Vegetable and the Animal; that these cover, adorn and vary the external crust of our earth: Yet we observed to you, were they all made out of one matter; one simple primary matter, w^c was, and is constantly changing out of and into all the various substances, w^c every where, and incessantly meet the observer's eye.

We told you, that altho' all things change, yet nothing was lost in creation; the sum total of matter being perfectly the

B

the same now, as when this goodly frame first issued from the hands of the Almighty.

We said, that no one, on a moments reflection, could suppose that every birth of an animal, or every production of a vegetable that daily occurs in the world, was an absolute fresh creation; - an evocation - or calling of something out of nothing. On the contrary we say, that what is called generation & growth, was a change, or mutation out of something w^c before existed. Now the principles of mutation, or the laws of change was an enquiry that exercised the faculties of the most distinguished philosophers of ancient times; and none pursued the investigation with so much success, did Aristotle, the Prince of ancient philosophers, and the founder of N. History -

We were speaking of this distinguished personage at the close of our last lecture — We thought it needless to tell you that he was preceptor to Alex^r. the great; who allowed him, an almost incredible sum of money, to procure rare animals & to perfect Ndt^y. Plato called him the "genius of Nature", as if their deity Nature had made use of Aristotle's excellent understanding for her interpreter. Every thing which he has given to the world is so solid & so regular, and there are so many marks of wisdom & judgement in all his thoughts that we cannot help regarding him, in point of talents, among the first of the human race. His stile has been.

complai

*Matter, in the vulgar acceptation of the word, denotes a body
that is tangible, visible & extended. But among Philo-
sophers it is the substratum of sensible qualities, and is
that invisible something, of which all bodies are composed;
and in this sense, it is synonymous with element: so that
m.^r is not that w^c we immediately see, or handle, but
the concealed subject, or support of visible & tangible
qualities.

complained of as dry & obscure; but this proceeds more from his subject, and from his peculiar way of diving to the very bottom of things, than from affectation or choice.

"It is difficult beyond ordinary conception to pierce through the thick clouds of nature; to unveil her most retired secrets; to labour in a vast abyss; to pursue truth through ways hitherto unknown & yet be obvious & intelligible to every person,"* as you will allow if you accompany us through his investigation of the primary m^r. & the doctrine of mutation.

We encounter no small difficulty in attempting to give the epitome of a volume in a few pages. We shall :: exert ourselves to help you to understand it, or rather to give you a glimpse of it, provided you will, in return, give me your attention. Matter &c (*.)

* Principia Comp & Dissolutae

Matter is that elementary constituent in composite substances, w^e appertains in common to them all, without distinguishing them from one another.

Every thing generated or made, whether by Nature, or art, is generated or made of out of something else; and this something else is called its subject or matter; such is iron to the knife, such is timber to the house.

Now this subject or matter of a thing being necessarily previous to that things existence is necessarily different from it, and not the same: thus iron is not a knife, and timber, as timber not a house.

house; yet iron is the subject or matter of a knife, because tho' not a knife, it may still become one. *E. contrario* — Timber is not the subject or matter of a knife, because it not only as timber, is no such instrument, but can never be made one, from its very nature & properties. Hence then one leading character of matter is that of aptitude, or Capacity [i.e. it has an aptness to change, or a capacity of taking on another form or quality.]

There can be no [immediate] change of one thing into another, where the two changing beings do not participate the same matter: e.g. a knife may be changed into a chisel; and a ² chest into a table; but not into a knife. But were the wood of this table to moulder under ground, & turn into earth, and that earth by a natural process subterranean process to metallize & become iron [^{here} as you see through such a progression indeed as this, we might suppose even this table to become a knife. — Hence ∴ it is, that all change is by immediate, or mediate participation of the same matter.

— This we have chosen to illustrate from works of art, as falling more easily under human observation: the principle is :: no less certain as to the productions of Nature, tho' the superior subtlety in these renders examples [at this early period of our enquiry] more difficult.

The application — or rather the question then is — whether in the ^{world} v.^c we inhabit, it be not admitted from experience, as well as from the confession of (thorough) Naturalists & Philosophers, that substances of every kind, [whether natural or artificial] either immediately

It is to be presumed, says Cronstedt, in his admirable Essay on Mineralogy,
that the Creator made only one kind of matter, from which every thing we meet
with in this world has been produced. p. 3. Vol. 1st.

immediately, or mediately pass one into another? — that reciprocal deaths, dissolutions & digestions support, by turns, all such substances out of each other. — The question, in short, is — whether in this world w^c we inhabit, there be not an universal change, or mutation of all things into all? — If there be, then must there be some the primary matter, common to all things. — I say some one primary m^r, and that common to all things; since without some such matter, such mutation would be wholly impossible.

Do you perceive, from what has been said, that there must, necessarily have been one primary m^r out of which all things are made? — 'Tis true the primary m^r is a being that flies the perception of every sense; and is, at best, even to the intellect a negative object; no otherwise comprehensible yn either by analogy or by abstraction; for matter in its primary form was never seen by Adam or his descendants —

We ^{obtain} gain, a sight of it by analogy, when we say 'that as if the Brass to the Statue, the Marble to the Pillar, the Timber to the ship, or any other secondary m^r to any peculiar form, so the primary or original matter, to all the various bodies in the universe'

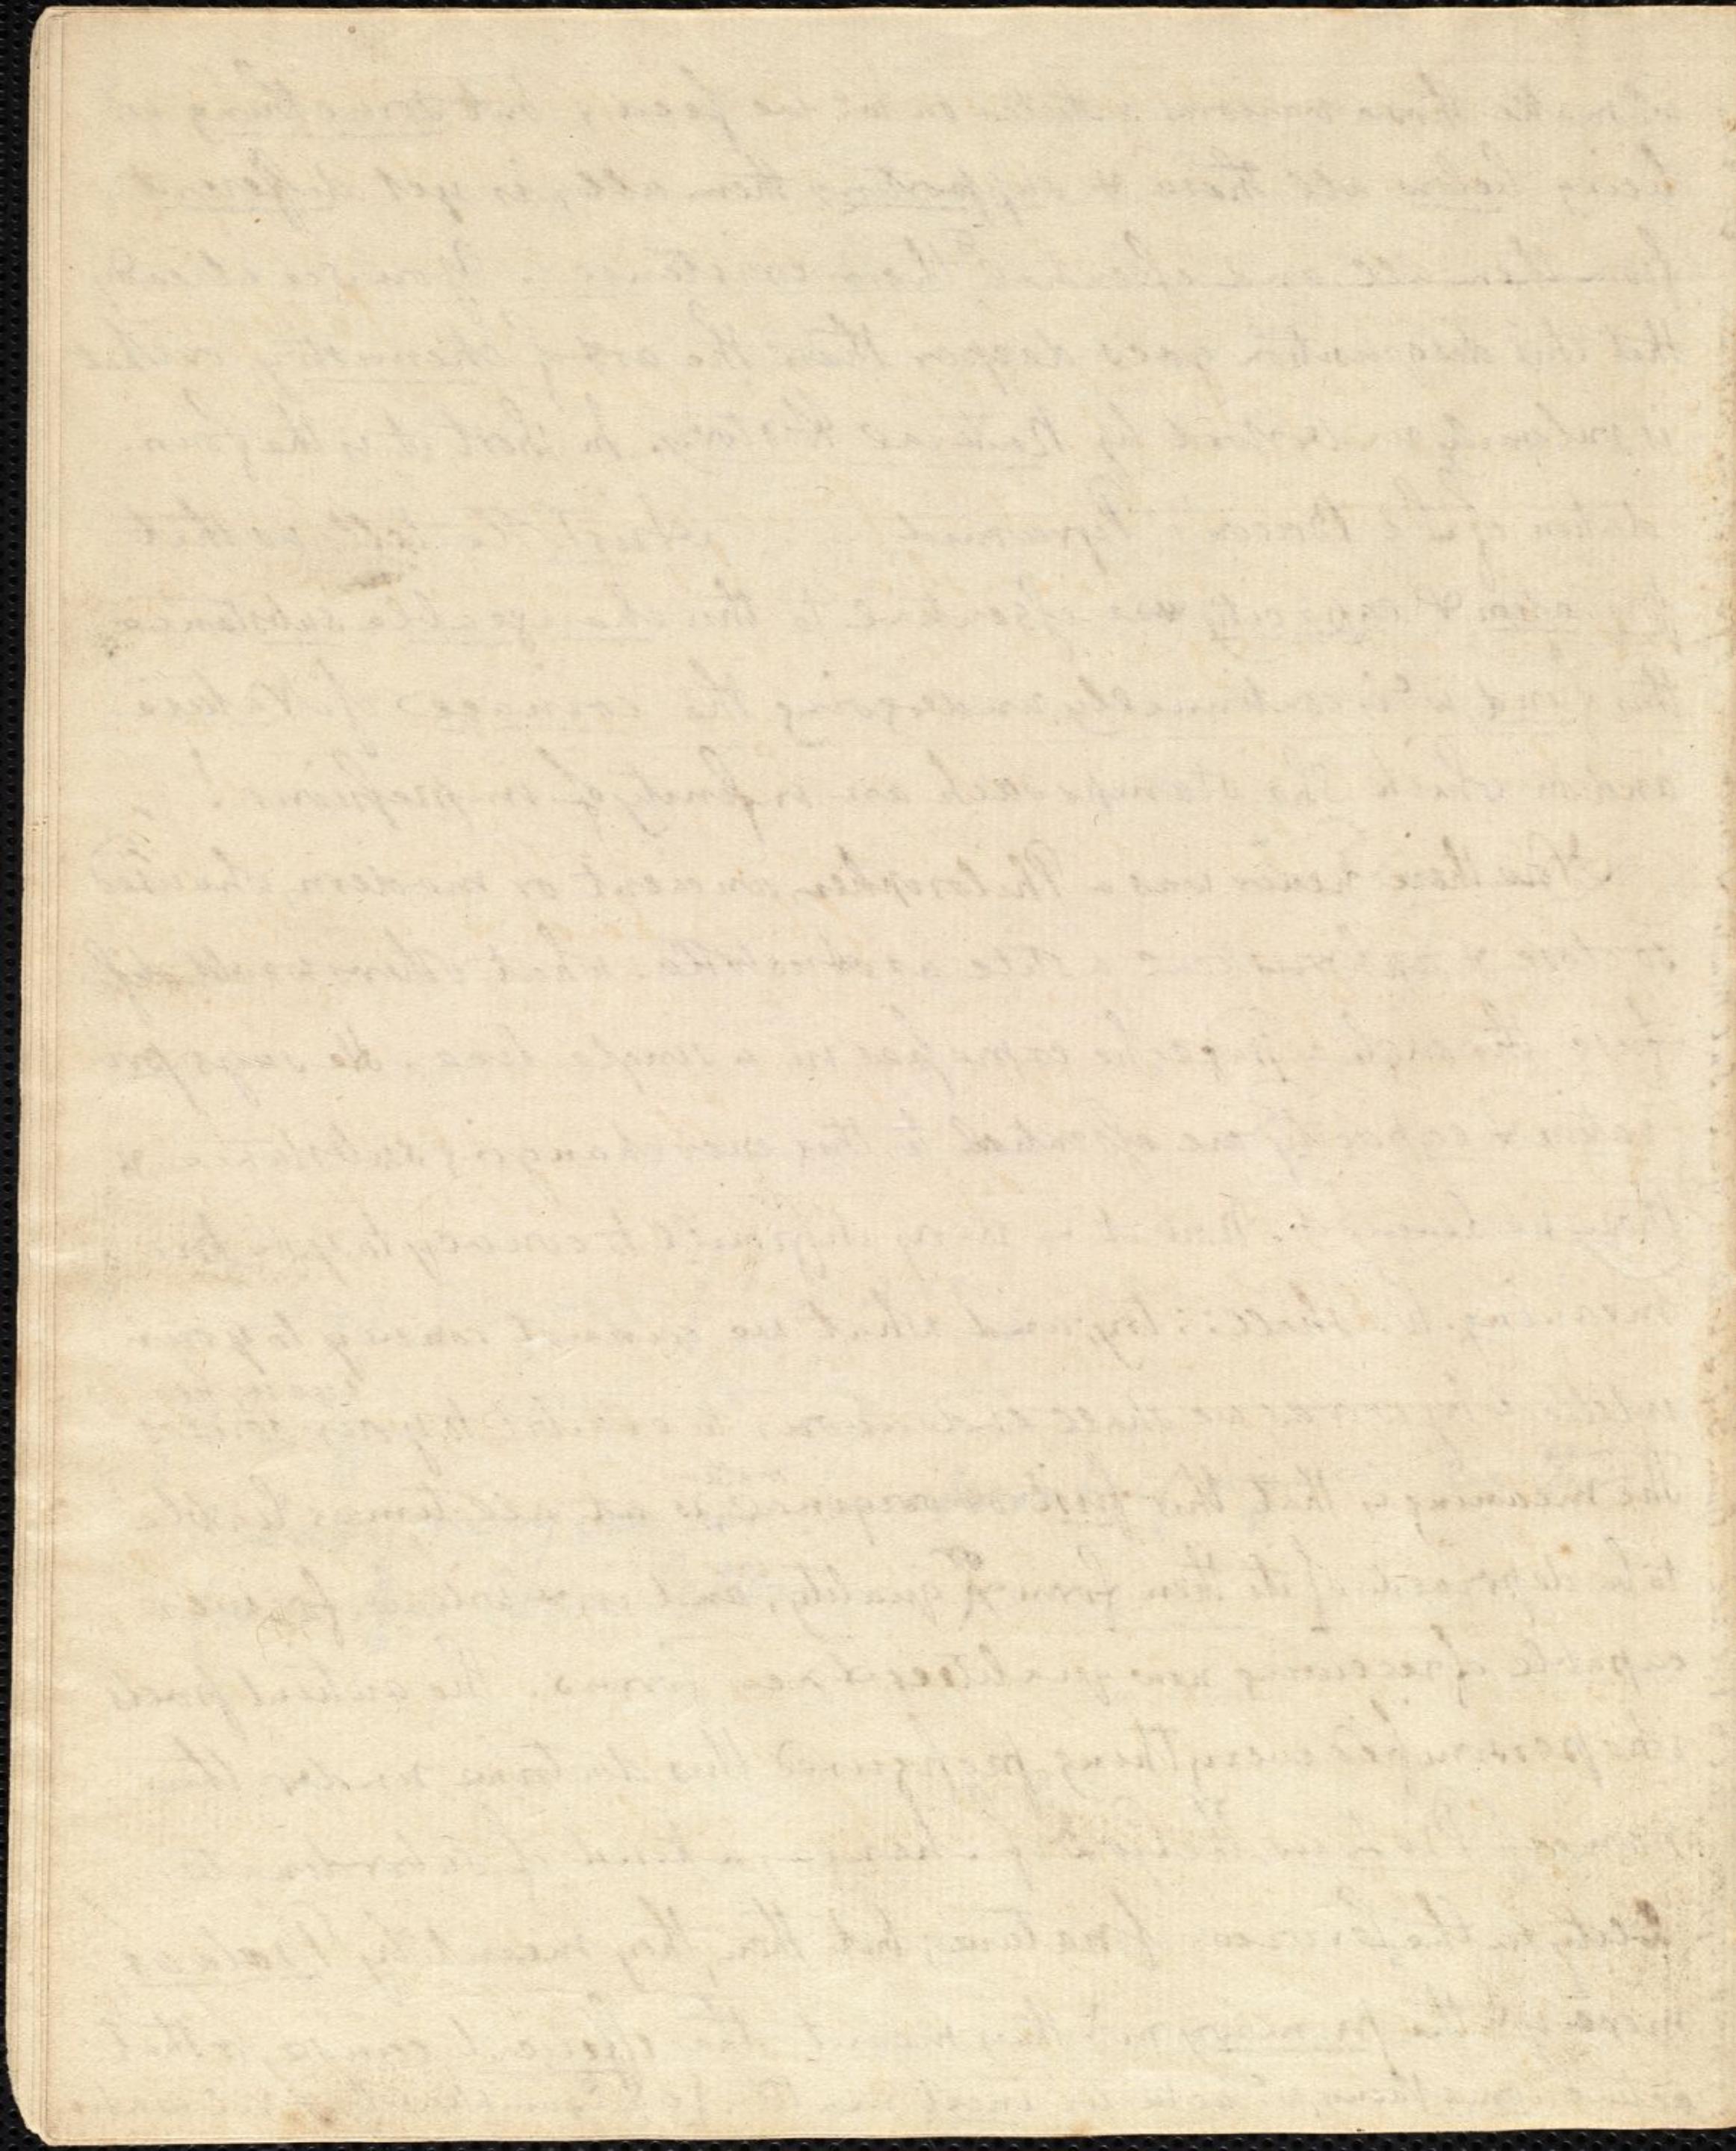

We gain a glimpse of it by that operation of the mind denominated, by metaphysicians, abstraction, when we say, that the primary matter is not the lineaments & complexion w^c makes the beautiful face; nor yet the flesh & blood w^c make those lineaments & that complexion; nor yet the liquid & solid, ^{or food} elements w^c make that flesh & blood; nor yet the simple bodies of earth & water

A Lady's handkerchief may be suggested in the
form of a love letter -

A Lady may see her handkerchief again in the
form of a love letter -

w^c make those various articles on w^c we feed; but something w^c
being below all these & supporting them all, is yet different
from them all, and essential^{to} their existence. You see already
that this disquisition goes deeper than the art of chemistry, or what
is vulgarly understood by Nature History. In short, it is the foun-
dation of Ld Bacon's Pyramid. - Aristotle tells us that
privation & capacity are essential to this changeable substance,
this fund, w^c is continually undergoing the coining of Nature,
and on which She stamps such an infinity of impreisions!

Now there never was a Philosopher, ancient or modern, who used
so close & aphoristical a style as Aristotle: what others would dif-
fuse through a page, he expresses in a single line. He says privi-
vation & capacity are essential to this ever changing substance, &
there he leaves it. Now it is very difficult to convey to you his
meaning. We shall try; and what we cannot convey to your
intellect by words, we shall endeavour to exhibit to your ^{eye sight} senses.
The meaning is, that this first or original, ^{matter} is at all times liable
to be deprived of its then form & quality; and is, & will be forever
capable of receiving new qualities & new forms. The ancient poets
who personified everything, prefigured this doctrine under the
name of Proteus, the God of change, a kind of subordinate
Dity in the service of nature; but then, they meant by Proteus,
more y^m the primary m^r: they meant the effluent cause, or that
active something, w^c actuates inert matter. [e.g. Examples Salom & Vol. alk. &c.

The ancient Poets represented the primary ^{or} matter which we have been speaking, under the character of Proteus. You all know that it is the custom of Poets to give to abstract truths a body; and to cloath it in the drapery of allegory: and almost all the fables of the poets, are philosophic opinions personified, & thus dressed up.

It is said in the fable of Proteus, that he had his herd of seals, or sea-calves, on the sea shore; - that 'twas his custom to tell these over every day, & then to retire into a cavern of the rocks & there repose himself. Whoever desired his assistance must first catch him in a net or chains & hold him fast; for when at liberty he would turn himself into all manner of forms; not only into the shapes of birds, beasts & reptiles, but sometimes into fire, sometimes into water, till at length he is restored to his primary or original form again.

Of this fable Lord Bacon gives the following explanation. - that under the person of Proteus is signified matter, the most ancient of all things next the Deists: - that the herd of Proteus is nothing else than the ordinary species of animals, plants & minerals, into w^c matter appears to diffuse & consume itself. [observe that Proteus & his herds were from the Ocean; alluding to the doctrine of ancient, as well as modern times, that animated nature came from the fountains of the deep; and the fable of Venus (the vis genetrix) rising out of the sea bears the same signification]

Virgil referred to this philosophy, (as explained by L. Bacon) when he says of Proteus

"Omnia transformat se in miracula rerum:

"Ignemque, horribilemque, feram, fluviumq. liquentem."

And Homer says of Proteus, that "He became each living thing ^{that}

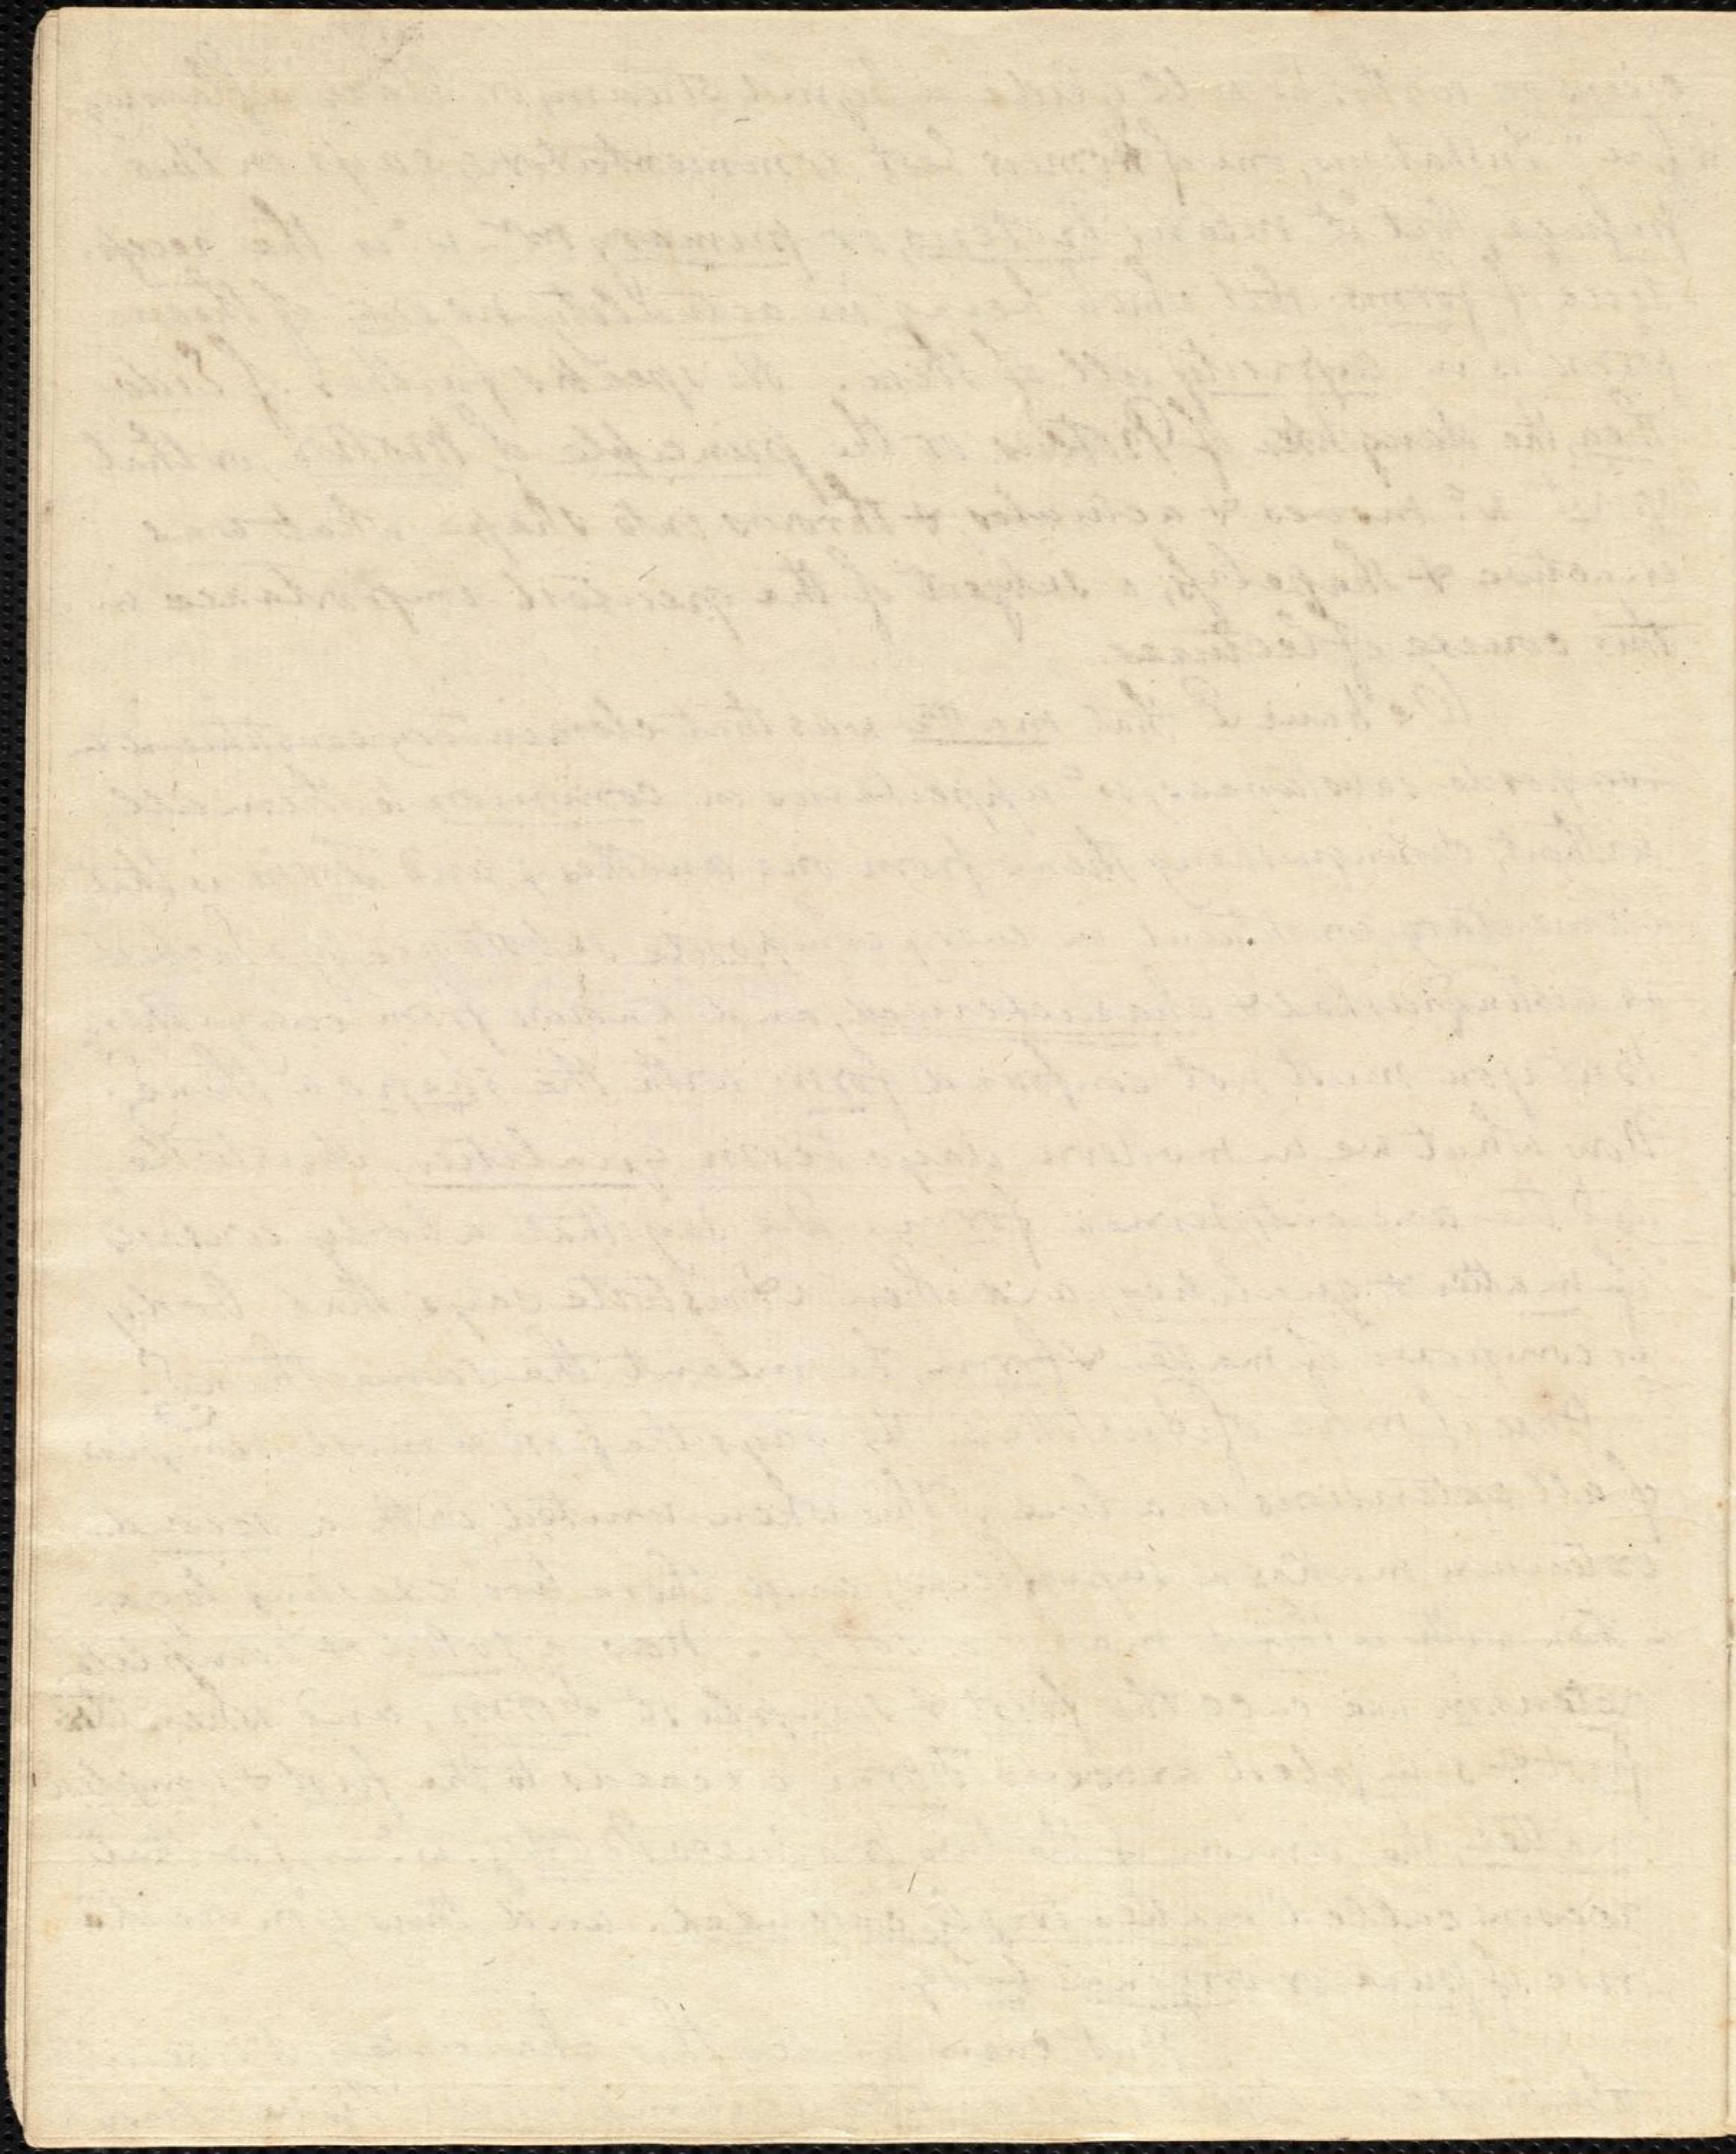

honesty. I have not had time to go over it all
and will do so when I have time. I am
now going to bed.

creeps on earth; he will glide a liquid stream, or blaze a flaming fire." Eustatius, one of Home's best commentators, says on this passage, that it means Proterus, or primary matter; i.e. the receptacle of forms; that which being in actuality, no one of these forms, is in capacity all of them. He speaks farther of Eidothea, the daughter of Proterus, or the principle of motion, or that "spirit" w^c moves & actuates, & throws into shape, what was inactive & shapeless; a subject of the greatest importance in this course of lectures.

We have S. that matter was that elementary constituent in composite substances, w^c appears in common to them all, without distinguishing them from one another; and Form is that elementary constituent in every composite substance, by which it is distinguished & characterised, and known from every other. But you must not confound form with the shape a thing. Now what we in modern days term qualities, Aristotle, and the ancients termed form. We say that a body consists of matter & qualities; and when Aristotle says that body is composed of matter & form, he meant the same thing.

One of more of Aristotle. He says the first & most simple of all extensions is a line. This when united with a second extension makes a superficies; and these two existing together, with a third make a solid. Now a solid & complete extension, we call the first & simpler Form; and when this first & simpler exceeds Form accedes to the first & simpler matter, the union of the two produces Body; w^c is, for that reason called "matter triply extended". and thus you see the rise of pure, or original body.

But even under this character, it is scarcely to be made an object for scientific contemplation. 'Tis necessary to

to this end that its extension should be bounded; for as yet we have treated it without such regard. Now the bound, or limit of simple Body is figure, w^c is the next form or attribute after extension. In Body thus bounded by Figure, every other of its attributes being abstracted & withdrawn, we behold that species of Body, called Body Mathematical; a name so given to it, because the mathematician as such, considers no other attributes of body, except it be those two primary, its extension & Figure. [But you must remember that figure & form are not the same, for the latter means the essence of a thing & not its shape or figure.]

But thô the bounding of body by figure is one step towards rendering it more definite & knowable, yet it is not sufficient for the purposes of Natural History & Chemistry. 'Tis necessary here that not ~~not~~ ^{only} the external should be duly bounded, but tha a suitable regard should be likewise had to its internal.

This Internal adjustment, disposition, or arrangement, [denominate it w^c you will] is call Organization, and may be considered as the third form, or attribute w^c appertains to Body. By its exception we behold the rise of Body Physical, or Natural; for every physical or natural is, some way or other, organized. [not excepting even minerals.]

And thus we may affirm that these three, that is to say, Extension, Figure and Organization are the three original forms or attributes of Body Physical, or Natural; Figure having respect to its external; organization to its internal, and Extension being common both to the one & the other.

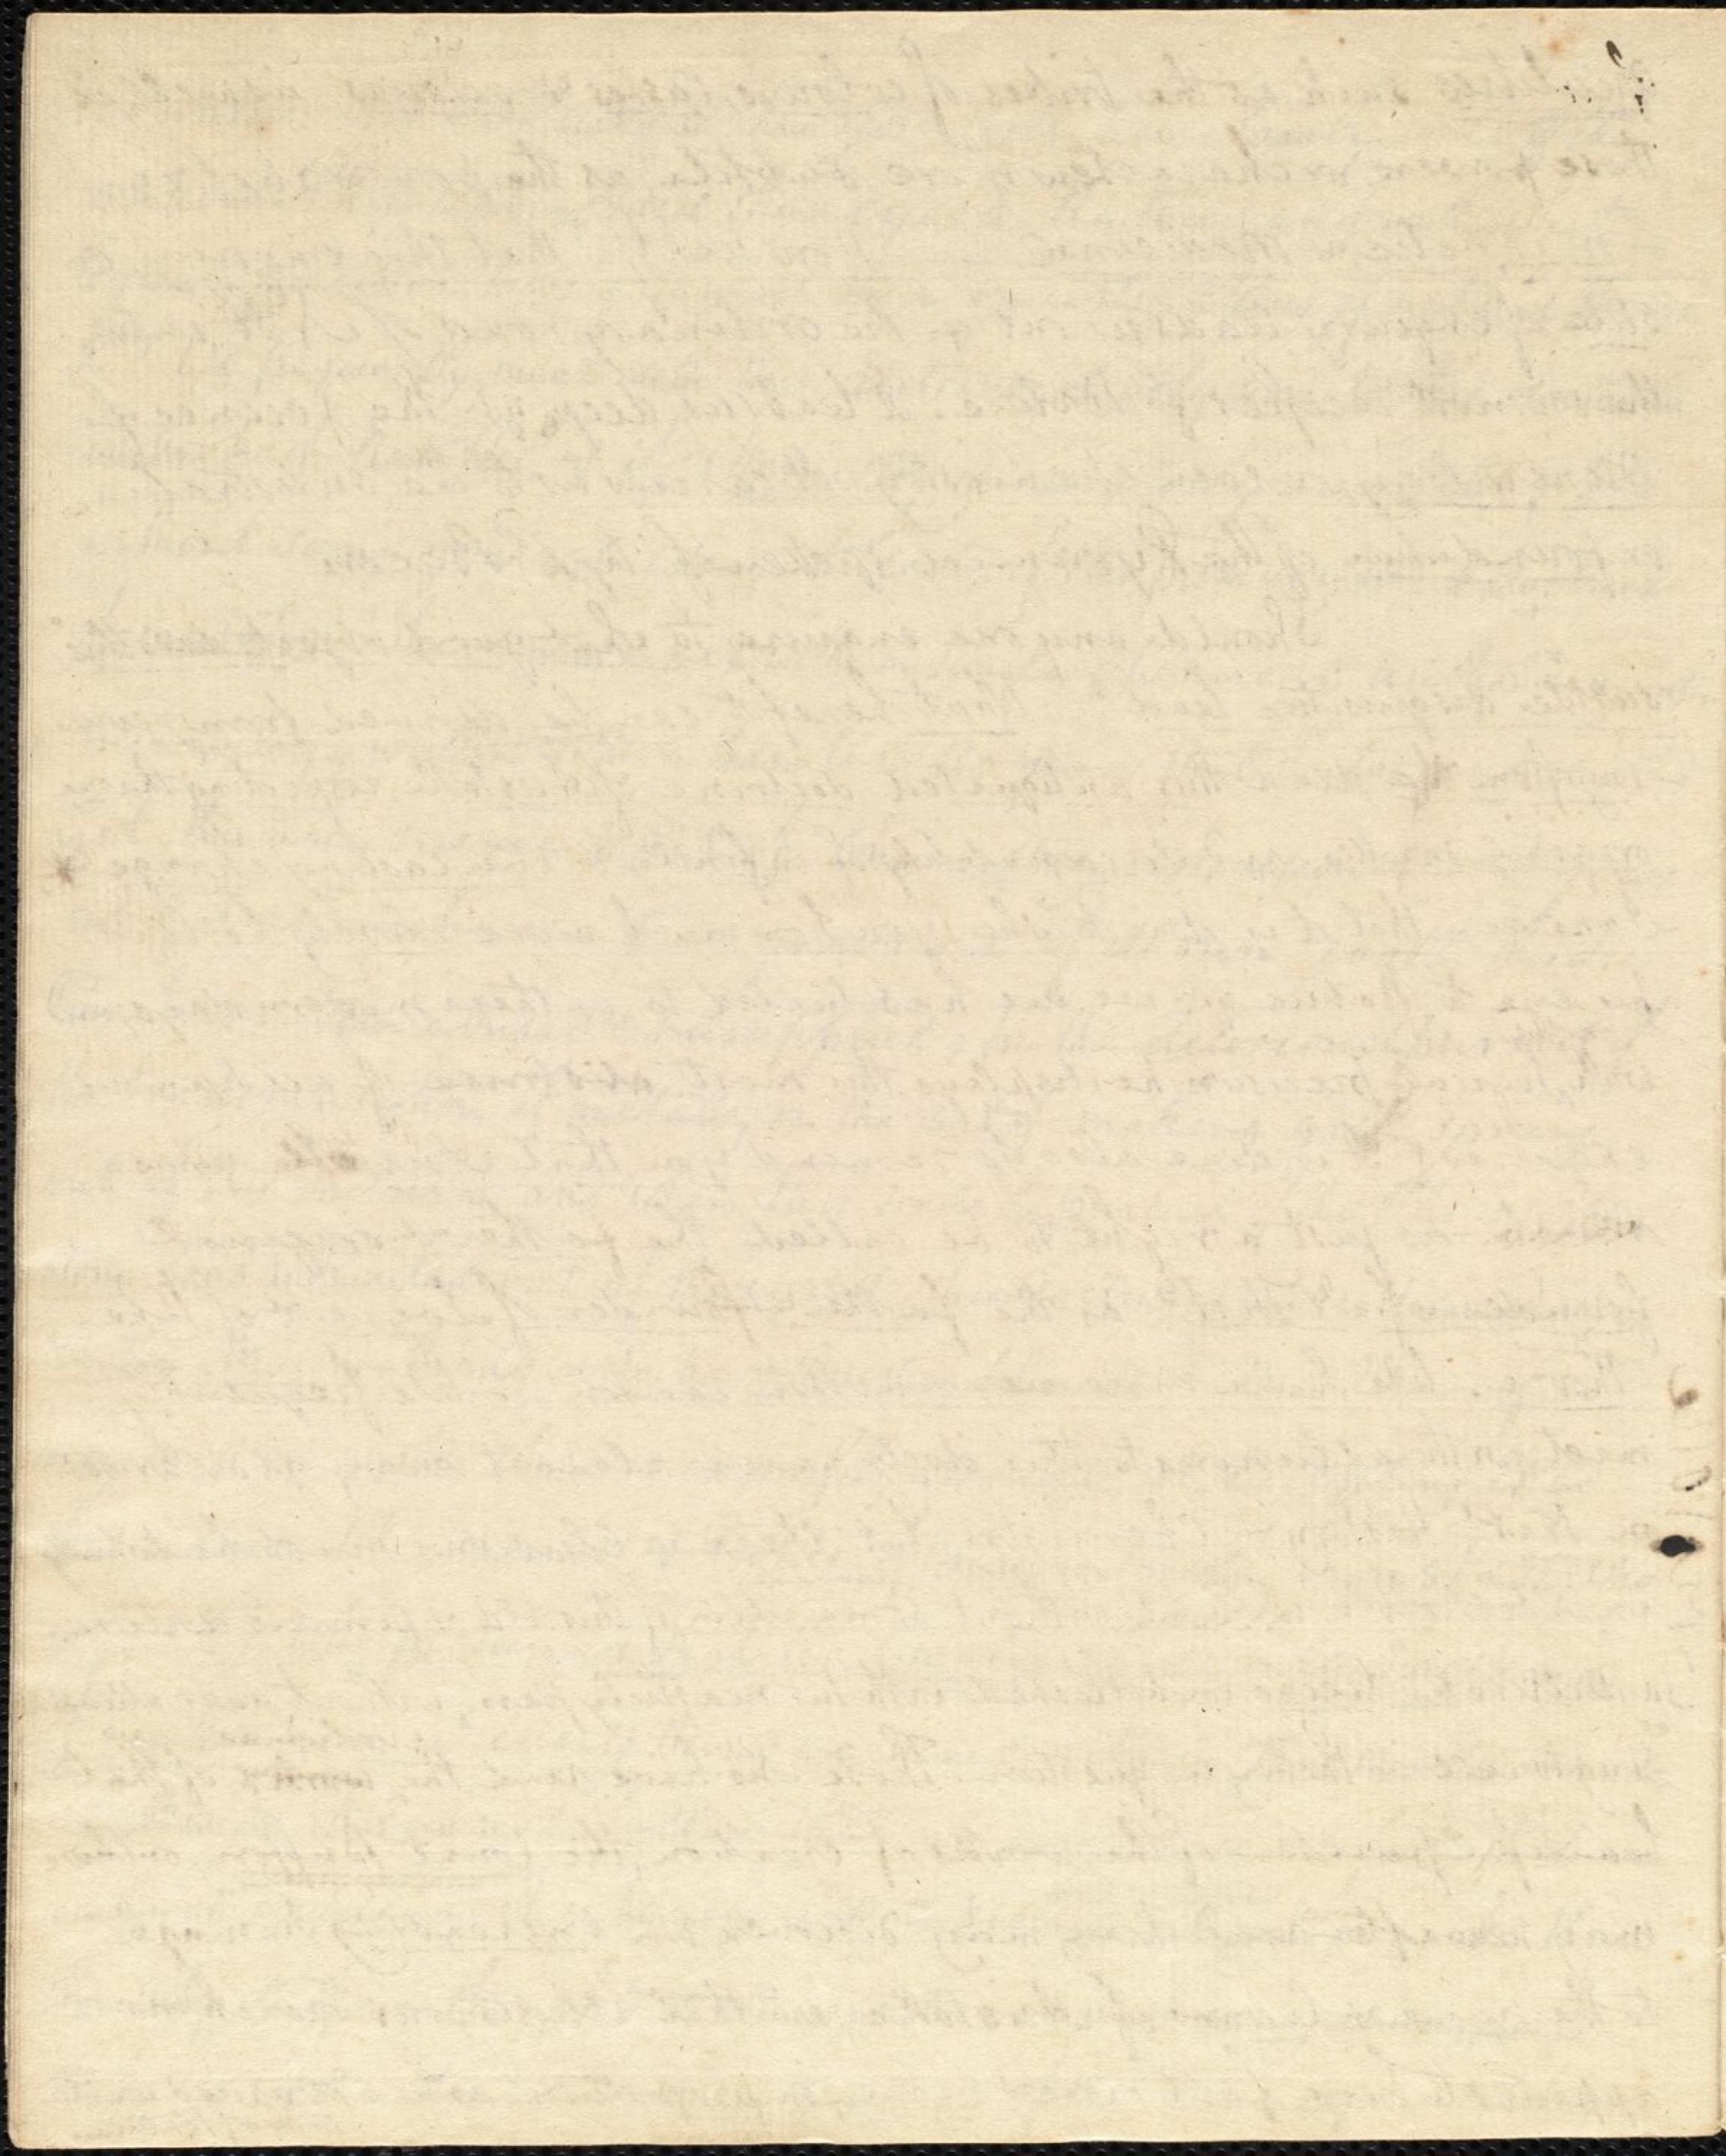

It is probable, nay more yr. probable, that from the variation in these universal, and as we may say primary forms or attributes arise most of the secondary forms, usually called Sensible Qual

* We answer that it is done to shew you first, how closely some of the ancient Philosophers laid their eyes to Nature; and with what logical precision they pursued their investigations of natural things. ^{2dly} We frequently meet with this doctrine, or allusion to this doctrine in books of Nat'ths. & of Chemistry, w^c is totally unintelligible without some general idea, at least, of this primary in^m. & doctrine of mutation. I have never met with a single chemical author ^{or any author} on mineralogy, written within these last 100 years that enters into it; and yet the very science & art of Chemistry rests upon it ~~and~~ grows out of it, as much as a tree grows out of its own root. This doctrine has:: been abused & misapplied; for the delirious pursuit of the transmutation of metals, or the art of making gold sprung out of this doctrine; and when this sordid pursuit of the Philosophers stone was ridiculed out of the world, this doctrine was ridiculed also. Newton - Bacon - Boyle - & Locke & Prestley believed it. But I know of no very modern writer who has expressly avowed it, excepting it be that admirable chemist & Prince of Mineralogists Cronstadt, who says "It is to be presumed that the Creator made only One kind of matter from w^c every thing we meet with in this world is made

Beside it does not follow that no subject is useful that we cannot explain. It is beneficial to discuss ^{certain topics} subjects, & make them the subject of our thoughts & conversation. Some may even pass through life without ever once thinking of this doctrine of mutability.

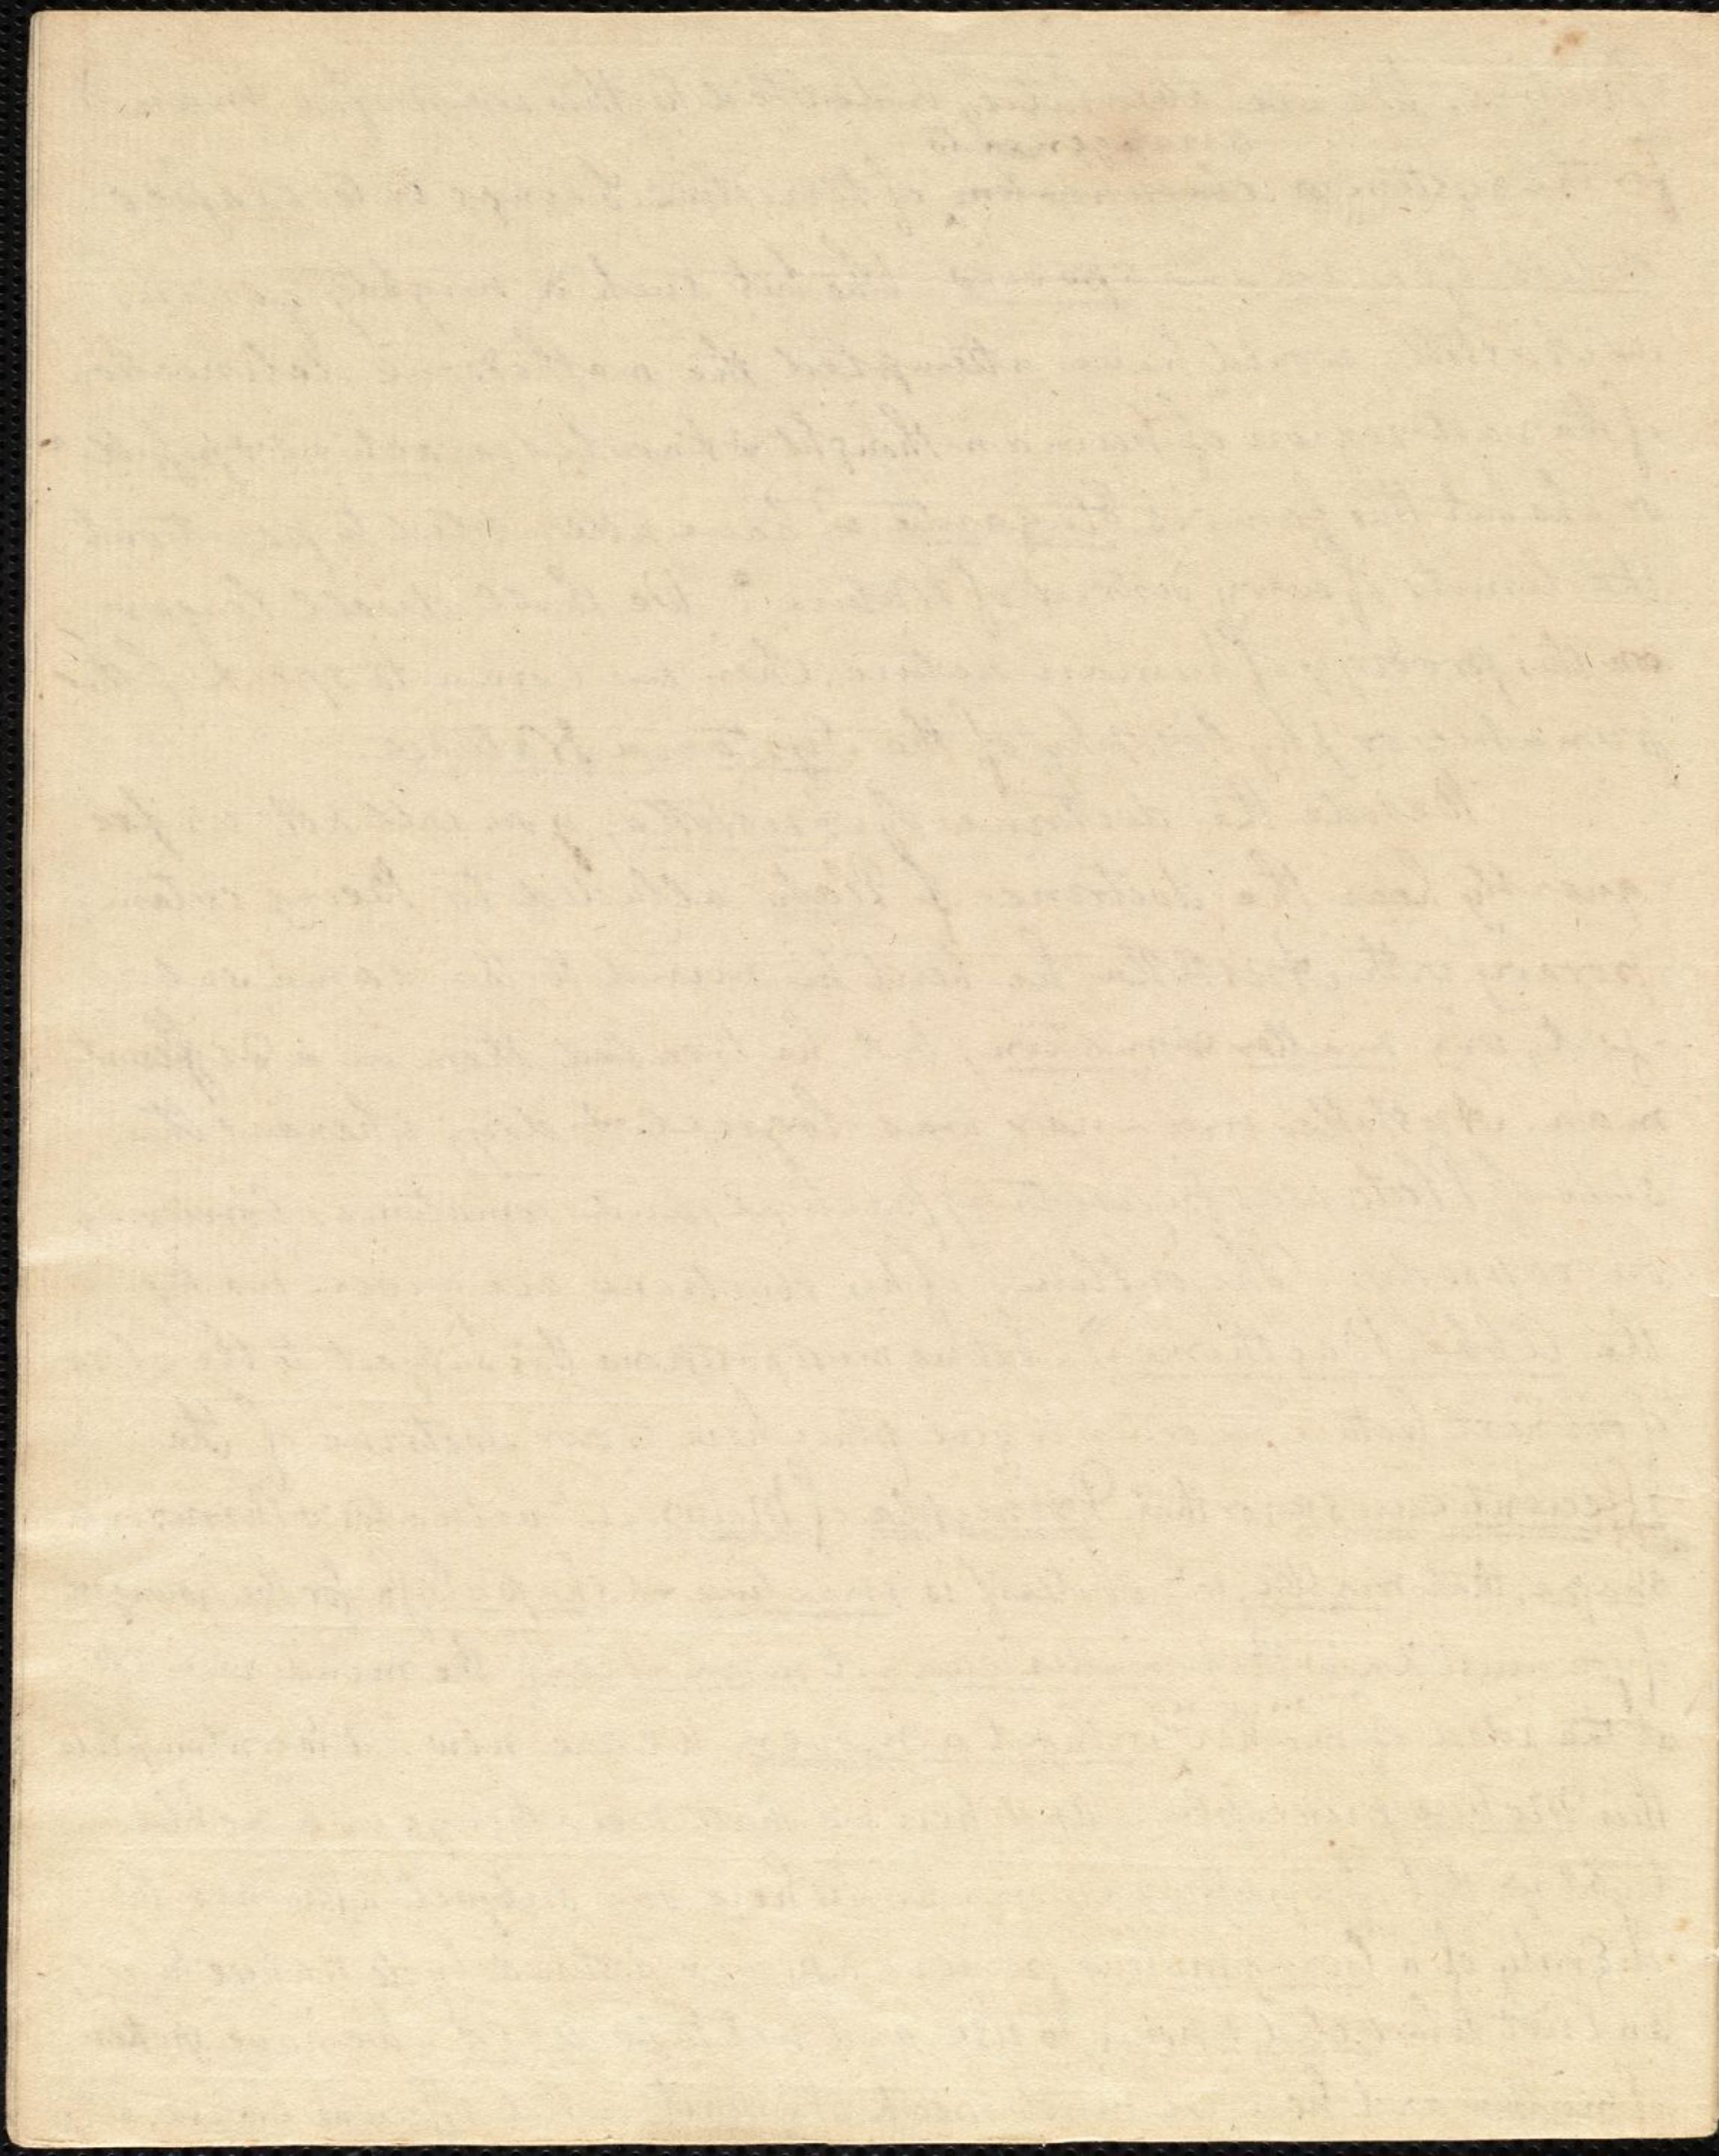

qualities, such as the tribes of colours, tastes & odours; as well as those powers, or characters more subtle, as the powers electric, magnetic & Medicinal. — You see (g.) that this enquiry, or style of enquiry leads us out of the ordinary road of Nat^t, into the inmost recesses of Nature. It leads us deep into the science of Mineralogy, or even chemistry. It carries us to the substratum, or foundation of the Pyramid, spoken of by L^d Bacon.

Should any one enquire, to what good object does this subtile disquisition lead? What benefit can be derived from reviving from the dead this antiquated doctrine of Aristotle, respecting the one original matter, and its capability of infinite & everlasting change? * I answer - that it is done to shew you how much more closely he laid his eye to Nature, w^c we are habituated to, in these modern days; and with logical precision he displays this most abstruse of all human enquiries. It is done also, to remind you that Aristotle deserves as just a right to be called the father & original founder of Nat^tHist^y, as the father & founder of Logic & of Phys^ology. We have moreover another reason -: We frequently meet with allusions to this doctrine in almost every good writer on Nat^t. History & Chemistry; but these allusions must be totally unintelligible without some idea of this old & famous doctrine, a doctrine w^c Cicero embellished with his masterly pen, without ever attempting to call its theory in question. Those who have read the ^{volumes} works of that beautiful painter of the works of creation, the Count Buffon, or those may hereafter read them, may discover an increasing homage to the name & labors of Aristotle; w^c that illustrious Frenchman appears to have felt more & more, in proportion as he advanced in the study of Nature.

of nature. We are absolutely indebted to this wonderful man
for the system, or ~~classification~~^{arrangements}, of terrestrial beings into classes
orders, genera and species. Who but such a mighty genius
as Aristotle, would have attempted the methodical delineation
of the vast region of human thought & knowledge, actual & possible?
or who but this famous Stagirite w^c have attempted to point out
the limits of every district of Nature? We shall dwell longer
on this prodigy of human nature, when we come to speak of the
principles or phylosophy of the Systema Naturae.

Beside the doctrines of Aristotle, you will not unfre-
quently hear the doctrines of Plato alluded to. Being contem-
porary with Aristotle, he bent his mind to the same sub-
ject, viz matter & motion; but he treated them in a different
man. Aristotle's manner was logical & dry; whereas the
stile of Plato was figurative, poetical, and sometimes bordering
on rhapsody. The outlines of his doctrine are given us by
the Abbe Barthomeij: but we must postpone this subject to the close
of our next lecture, in order to give place here to our doctrine of the
Efficient cause; or that Principle of Motion, w^c actuates, & throws into
shape, that matter, w^c of itself is inactive & shapeless: for the youngest
of you must know that matter cannot move itself; the mind revolts
at the idea of matter ^{moving} without a mover. We are now led to contemplate
this Motive principle. And here we shall view things in a nobler
light up: that of a passive element. 'Tis here our subject assumes the
dignity of a living motive power; a power destined by its nature to act,
and not to be acted upon; to use, and not to be used. We have spoken
of matter, and here we must speak of Spirit, or that Efficient cause, w^c i.

the Pimum Mobile of all you see in creation! For as there was a primary matter, so was there a primary Life, that like the latent oxygen in the egg, when combined with heat developed this goodly frame of the world!

"Who ere the morn of Time,
With wings outstretch'd, o'er Chaos hung sublime;
Warm'd into life the bursting egg of Night,
And gave Young Nature to admiring Light!"

[Darwin's Temple of Nature]

Lest we should puzzle you as much with this primary Life, as I fear, we have with the primary matter, we shall postpone its discussion to our next lecture.

The time must have been when an animal was produced without a parent,
and a vegetable without a seed. at this time the world must have been in-
fluenced by a power different from any it possesses at present; for now no
such power is now to be found in any part of the globe (See Earth 124)
